Pre-preamble

Possessive construction

Head
theory

Dependent
Chomsky
the theory of Chomsky
Chomsky.GEN his-theory
... Chomsky-ADJ-AGR theory of Chomskyan theory
(Possessive adjective)

This means that there’s a close relation between the notions of
‘nominal dependent of a noun head’ and
‘attributive modifier of noun head’
Some languages even use the same devices to express each type of
dependency
(e.g. Persian ezâfe)
Pre-preamble

Note: inalienably possessed nouns (arguably) have an argument structure.

Masha’s hand

Masha’s daughter

(In some languages such nouns are obligatorily possessed, e.g. Athabaskan)

Such (subcategory obligatory?) complements to nouns can be realized by possessive adjectives:

Maš-in-a ruka

Maš-in-a doč’

[Russian]

Outline

1. Pre-preamble: the possession-modification connection
2. Preamble: ‘Contextual’ vs ‘inherent’ inflection
3. Lexical representations and lexical relatedness
4. Selkup denominal adjective transpositions
5. GPFM analysis of Selkup
6. Selkup and the MODIFIER GF
7. Summary and Conclusions

Contextual/inherent inflection

- Lexemes inflect for coherent sets of properties: tense, aspect, . . . , number, case, . . .
- Some properties are mandated by the needs of syntax: government/agreement
- Some properties are under speaker choice and are determined by syntactic context to a lesser degree (or not at all)
Contextual/inherent inflection

Terminology (Booij)

- First set of properties: ‘contextual inflection’
  These are determined by syntactic context
- Second set of properties: ‘inherent inflection’
  These are inherent to the lexeme itself

Examples of contextual inflection (following Booij):

- adjective - noun gender agreement
- subject-verb agreement
- (structural) case marking (e.g. German nom/acc/dat)
- Construct State forms (not in Booij)

Inherent inflection

Examples of inherent inflection:

- plural number on nouns
- past tense on verbs

Construct State in DhoLuo (Nilotic)

ot ‘house’  od winyo ‘a bird’s nest’
udi ‘houses’  ut winyi ‘birds’ nests’
Inherent inflection

Inherent inflection reflects a (potential) speaker choice
Contextual inflection doesn’t permit speaker choice (usually!)

Implications:
Inherent inflection is meaningful
(otherwise it would have no function)
But how do we capture the idea ‘meaningful inflection’ without making it look like derivation?
See later (‘GPFM analysis’)

Problems with ‘contextual/inherent’ distinction

- Some grammatical properties seem to belong to both types
  E.g. ‘pro-drop’ problem
- Some values of a given property may be contextual (e.g ‘structural’ cases) and others inherent (i.e. ‘semantic’ cases)

A given case (e.g. dative-allative) may itself be either ‘structural’ functions or ‘semantic’ functions
Choice of a contextual inflection may itself be meaningful, e.g. differential subject/object marking to signal agency, animacy etc.
Problems with ‘contextual/inherent’ distinction

Additional problem:
how do we distinguish between (lexically etc. restricted) inherent inflection and (completely regular, productive, transparent) derivational morphology?

In this talk I will argue that these questions are related to a more general problem - lexical relatedness

Modification

Parallel problem:
Attributive modification -
This is a kind of grammatical function/relation, but how is it related to government/subcategorization?

Assumption: there is some GF, say, MOD

Modification

Attributive modification canonically expressed by Property denoting lexeme, i.e. Adjective

But also expressed by:

- verbs: ‘participle’
- nouns: ‘relational adjective’

The solution

We need to look at these relationships in terms of the general problem of lexical relatedness

There are many sorts of lexical relatedness

To understand these we need to factorize lexical properties

Lexemes can be related to each other along (almost) any combination or permutation of these properties
Overview of talk

- Summary of assumptions about lexical representations
- Generalized characterization of ‘lexical relatedness’
- Summary of nominal morphology of Selkup, esp. adjectival ‘representations’ of nouns
- Analysis of lexical relatedness in Selkup
- The MODIFIER function and Selkup

Outline

- Pre-preamble: the possession-modification connection
- Preamble: ‘Contextual’ vs ‘inherent’ inflection
- Lexical representations and lexical relatedness
- Selkup denominal adjective transpositions
- GPFM analysis of Selkup
- Selkup and the MODIFIER GF
- Summary and Conclusions

Lexical representations

Assume a lexical representation is at least four-dimensional, e.g. for Selkup noun qok ‘leader’ (bound stem form qo:-)

```
 FORM qo:-
 SYN N
 SEM [LEADER(x)]
 LI LEADER
```

Lexical representations

The LI is the Lexemic Index, an arbitrary label (integer) unique to each lexeme

Think of this as a key in a database
Generalizing ‘lexical relatedness’

We consider how one (FORM, SYN, SEM, LI) entry might be systematically related to another.

Relatedness is defined in terms of correspondences between corresponding attributes:

- FORM1 ⇔ FORM2
- SYN1 ⇔ SYN2
- SEM1 ⇔ SEM2

I’ll also argue that relatedness can involve the LI:

- LI1 ⇔ LI2

The GPF consists of four functions which map each of the attributes of a lexeme to corresponding attributes of a (possibly different) lexeme:

- \( f_{form} \)
- \( f_{syn} \)
- \( f_{sem} \)
- \( f_{li} \)

We only have a different lexeme if the GPF defines a distinct Lexemic Index for the output.

Generalizing ‘lexical relatedness’

In principle, any attribute of a lexical entry may map non-trivially to the corresponding attribute.

This gives rise to different types of lexical relatedness (not all of which have traditional names).

We define such relatedness using the ‘Generalized Paradigm Function’ (GPF).

(Canonical) inflection and (canonical) derivation

‘Pure’ inflection non-trivially affects only the FORM attribute, by specifying inflected word forms.

The SYN, SEM, LI attributes are retained unchanged.

This can be coded using Stump’s idea of an Identity Function Default IFD:

‘By default, the component \( f \) of the GPF is the identity function (“do nothing”)’
(Canonical) inflection and (canonical) derivation

E.g. for 3sg of English verbs, GPF =

\[ f_{\text{form}}(<\text{VERB}, \{3\text{sg}\}>) = X-s \ (\text{X' = VERB's root}) \]
\[ f_{\text{syn}}(<\text{VERB}, \{3\text{sg}\}>) = \text{identity function} \]
\[ f_{\text{sem}}(<\text{VERB}, \{3\text{sg}\}>) = \text{identity function} \]
\[ f_{\text{li}}(<\text{VERB}, \{3\text{sg}\}>) = \text{identity function} \]

Generalizing ‘lexical relatedness’

GPF for SubjNom process by -er suffixation, e.g. writer (preliminary formulation):

\[ f_{\text{form}}(<\text{WRITE}, \{\text{SN}\}>) = \text{Stem0(WRITE) } \oplus \text{ er} \]
\[ = \text{MORCAT = N} \]
\[ f_{\text{syn}}(<\text{WRITE}, \{\text{SN}\}>) = \text{SYNCAT = N} \]
\[ f_{\text{sem}}(<\text{WRITE}, \{\text{SN}\}>) = [\text{Thing} \lambda x \ \text{PERSON}(x) \land \text{WRITE}(x, \ldots)] \]
\[ f_{\text{li}}(<\text{WRITE}, \{\text{SN}\}>) = \text{WRITER} \]

7. Summary and Conclusions
Selkup noun morphology

Selkup: Uralic language of Samoyedic group

Nouns have three suffix position slots for:
- number {singular, dual, plural and collective}
- possessor agreement {person/number}
- case {nom, acc, gen, instr, caritive, transitive, coordinative, dative-allative, illative, locative, elative, prolate, vocative}

The three features are paradigmatic,
i.e. the values of [Number], [PossAgr], [Case] are mutually exclusive
(Kuznecova et al 1980:210)

Sample fragment of paradigm for qok ‘leader’ (ignoring Collective number forms)

Selkup possessor agreement

Paradigm fragment for 1sg possessed form ‘my leader’

Selkup: case-marked/possessed denominal adjectives

Similar forms found with the locational adjectives

qaqlı ‘sledge’ ⇒
qaqlō-qi-in (locative sg.) ‘in a sledge’
qaqlō-qı-i’ ‘located in a sledge’
qaqlō-qınti-i’ ‘located in their(2) sledge’ etc.

Noun or adjective?

Adjectival representation of noun retains some noun properties in the syntax

The noun base can be modified by another attribute

Noun or adjective?

po: ‘wood’
tol’ı ‘ski’
mitin ‘grease’

Noun or adjective?

[pо:]i’ [tol’i]-i’ mitin
Noun or adjective?

mat [pɔ:ra]-ni-fal’ qum
1SG.Gen size-L person
‘person of my size’ ("a my size-like person")

Selkup: summary

- Relational adjective/similitudinal/locative adjective suffixes are part of the inflectional paradigm (with all case suffixes and possessor agreement forms)
- Similitudinal/locative adjectival 'representations' involve addition of semantic predicate to inflected forms
- Noun base still 'visible' to attributive modifiers

Selkup: derivational denominal adjectives

Comparison with Proprieteive/Privative adjectives:
Proprieteive: N-simi’ HAVING(NOUN)
ys- ‘water’
yamma-torq hip
water-PROPR pot
‘pot with water’
Selkup: derivational denominal adjectives

Privative: N-kitil’ LACKING(NOUN)
ima- ‘wife’
ima-kitil’ tatiipi
wife-PRIV shaman
‘an unmarried shaman’

Outline

1 Pre-preamble: the possession-modification connection
2 Preamble: ‘Contextual’ vs ‘inherent’ inflection
3 Lexical representations and lexical relatedness
4 Selkup denominal adjective transpositions
5 GPFM analysis of Selkup
6 Selkup and the MODIFIER GF
7 Summary and Conclusions

Selkup: derivational denominal adjectives

Similar to relational, similitudinal, locational adjectives but closer to canonical derived forms
Can’t be formed from nouns inflected for possessor agreement
Noun base can’t be modified by attributive modifier

GPFM analysis of Selkup

\[
\text{GPFM(LEADER, \{<pl, 2plP, acc>\})}
\]

\[
\begin{array}{ccc}
\text{FORM:} & \text{qo:-} & \text{qoqqimi} \\
\text{SYN:} & \text{N} & \text{N} & \text{(by IFD)} \\
\text{SEM:} & \text{[LEADER(x)]} & \text{[LEADER(x)]} & \text{(by IFD)} \\
\text{LI:} & \text{LEADER} & \text{LEADER} & \text{(by IFD)} \\
\end{array}
\]
GPFM analysis of Selkup

For inherent inflection

GPF induces a non-trivial mapping for FORM and SEM

but SYN and LI remain unchanged

E.g. for caritive inherent case ‘without N’

(Recall: IFD = ‘Identity Function Default’, i.e. ‘by default, do nothing’)

GPFM analysis of Selkup

Selkup is unusual because it also turns the noun into a (kind of) adjective

In other words the similitudinal adjective construction is strictly speaking a combination of transposition and inherent inflection
GPFM analysis of Selkup

Note: we still need an analysis of the adjective/noun mixed syntactic category

(See Spencer 1999, in preparation for suggestions)

MOD

Cinderella grammatical function: attributive modifier of head noun

Canonically realized by lexeme denoting Property
(‘tall’, ‘blue’, ‘good’, . . . )

Outline

1. Pre-preamble: the possession-modification connection
2. Preamble: ‘Contextual’ vs ‘inherent’ inflection
3. Lexical representations and lexical relatedness
4. Selkup denominal adjective transpositions
5. GPFM analysis of Selkup
6. Selkup and the MODIFIER GF
7. Summary and Conclusions

MOD

Non-canonical type: modification-by-noun

Examples:

- N N compound (*preposition phrase*)
- Poss construction (*the preposition’s etymology*)
- Relational adjective (*prepositional phrase*)
‘Pure’ relational adjective is transposition

i.e. the adjectival form of a noun, but with no added semantic content

So the GF realized by the relational adjective transposition is just MOD

Relational adjectives are different from true derived denominal adjectives

Contrast Selkup ‘adjective representation of noun’ with Proprieteve/Privative types

Proprieteve/Privative - adjectives by virtue of (derived) semantic representation (denoting Properties)

These are distinct lexemes from base noun lexeme

Relational adjective (e.g. qol’)

Rather like inflected form of noun

In particular, the relational adjective is not a distinct lexeme

But Selkup also has transpositions which do add semantic content

Similitudinal/locational adjectival representation of noun is therefore a combination of

- transposition
- inherent (meaning-bearing) inflection
Outline

1. Pre-preamble: the possession-modification connection
2. Preamble: ‘Contextual’ vs ‘inherent’ inflection
3. Lexical representations and lexical relatedness
4. Selkup denominal adjective transpositions
5. GPFM analysis of Selkup
6. Selkup and the MODIFIER GF
7. Summary and Conclusions

Types of lexical relatedness

Summary of types of lexical relatedness including:
- Contextual inflection (meaning-preserving inflection)
- Inherent inflection (meaning changing inflection) - semantic cases
- Meaning-preserving transpositions - deverbal participles, relational adjectives
- Meaning-changing transpositions - similitudinal/locational adjectives
- Meaning-changing derivation, creating new lexeme - proprietary/privative adjectives

Conclusions

- Selkup has (standard) N ⇒ A derivation (with added semantic predicate)
- Selkup has inherent N inflection (with added semantic predicate, e.g. WITHOUT(N))
- Selkup has N ⇒ A transpositions
- ‘Pure’ relational adjectives are ‘pure’ transpositions, create noun form which can function as attributive modifier

Conclusions

- Sim/Loc adjectives are transpositions + meaning change
- All three transpositions are parts of inflectional paradigm
- Therefore, for Selkup the MOD function is realized by an inflectional category
